**Company Secretary and Compliance Officer**

Pregnant Stingray Offers Rare Lesson of Biology

Charlotte has spent much of her life in captivity at a nonprofit aquarium in North Carolina's Appalachian Mountains. She is an ocean animal called a round stingray.

Charlotte is about to give birth. The reddish-brown stingray is pregnant with as many as four young, called pups. They were created by a rare process of natural reproduction called parthenogenesis. A female animal develops an egg into an embryo without fertilization material from a male. Charlotte will give birth to her young at home: Team ECCO Aquarium and Shark Lab on Main Street in Hendersonville, North Carolina. Ramer formed the organization and serves as its chief.

"We don't know why it happens," Lyons said. "Just think of this really neat phenomenon that they seem to be able to do."

"We were all like, 'Shut the back door. There's no way,'" Ramer said. "We thought we were overfeeding her. But we were overfeeding her because she has more mouths to feed." The small aquarium encourages local schoolchildren and others to take an interest in science.

Other kinds of rays, and related fish such as sharks, have laid these kinds of pregnancies under human care. "I'm not surprised, because nature finds a way of having this happen," she said. "To be clear, Lyons said, these animals are not cloning themselves. Instead, a female's egg joins with another cell in the female. This leads to cell division and creation of an embryo."

Another Private US Company Aims for the Moon

The U.S. space agency NASA has launched a mission with six lunar lander built by a private U.S. company aiming to reach the moon next week.

SpaceX's Falcon rocket launched Intuitive Machines' lunar lander to the moon, 370,000 kilometers away, from NASA's Kennedy Space Center in Florida.

The agency is the main sponsor for the mission with six navigation and other technology experiments on the lander. If all goes well, the lunar spacecraft will try to land on February 22, after one day in lunar orbit.

High intake of niacin, essential B vitamin, linked to increased risk of heart disease: Study

Researchers have found that high levels of niacin, an essential B vitamin, could be directly linked with an increased risk of heart disease. The report, published in Nature Medicine, reveals that increased niacin level leads to high inflammation and damage to blood vessels.

Researchers found that the excess intake of niacin resulted in the production of a byproduct called 4PY. This metabolite reportedly plays a critical role in heart disease progression. Since the western diet includes a lot of niacin intake, it was found to have elevated the levels of 4PY in the bloodstream.

Study: Collapse of Ocean Currents Could Cause Major Climate Problems

Scientists are warning of the possible collapse of the Atlantic Ocean current system that would likely lead to worldwide climate changes.

Researchers identify the ocean system as the Atlantic Meridional Overturning Circulation (AMOC). They say the system plays an important part in moving, or circulating, salt and warm water around the world.

The AMOC system brings warm water to northern areas and carries cold water south, the U.S. National Oceanic and Atmospheric Administration (NOAA) explains. The circulation also transports nutrients necessary to support many kinds of sea life.

The Dutch team simulated 2,200 years of AMOC flow. The researchers added to the model expectations for future human-caused climate change. The results predicted "an abrupt AMOC collapse," after 1,750 years.

The Dutch team simulated 2,200 years of AMOC flow. The researchers added to the model expectations for future human-caused climate change. The results predicted "an abrupt AMOC collapse," after 1,750 years.

But the researchers noted it is difficult to provide a realistic date because the process could be influenced by many unknown circulation events. Making a prediction is also difficult because "current observational records are too short" to provide an exact estimation of collapse.

"This value is getting more negative under climate change," van Westen said. He added that when the AMOC reaches a certain level, the change does not happen over time, but would be more "cliff-like," he added.
