Dear Sirs,

Sub: Newspaper Advertisement - Results for the quarter ended 31st December 2022

Copies of the newspaper advertisements of the financial results of Beardsell Limited for the quarter ended 31st December 2022 published on 7th February 2023.

Please take it into your records.

Thanking you,

For BEARDELL LIMITED

Company Secretary & Compliance Officer

Encl: As above

Health Matters

New vaccine targets life-threatening fungal infections

A new vaccine from the University of Georgia could be the first clinically approved immunisation to protect against invasive fungal infections, a growing concern as antifungal drug resistance increases.

Fungal infections cause more than 1.5 million deaths worldwide each year and cost billions. They also double hospitalization costs, double the length of hospital stays and double the risk of death in hospitalised patients, according to a previous UGA study.

But there currently are no effective vaccines to protect vulnerable patients from fungal infections.

"There's a significant unmet clinical need for this kind of prevention and also treatment, particularly among immunocompromised individuals," said Karen Norris, lead investigator on the new study and professor in the College of Veterinary Medicine. "The patient population at risk for invasive fungal infections has increased significantly over the last several years."

The experimental vaccine is designed to protect against the three most common fungal pathogens that are responsible for

more than 80% of fatal fungal infections. The study tested the vaccine's efficacy in four preclinical animal models, including nonhuman primates. The researchers relied on different immunosuppressed models for the study, reflecting drug regimens similar to those of transplant recipients, people with HIV or cancer patients, some of the most at-risk human populations.

The vaccine was effective in developing protective antibodies in each of the models.

"Because it targets three different pathogens, the vaccine has the potential to be groundbreaking regarding invasive fungal infections," said Norris,

who is also faculty in the university's Center for Vaccines and Immunology. "Plans are underway to develop the vaccine for a Phase I (human) safety trial."

Fungal infections are most commonly seen in people with immune disorders, including those with uncontrolled HIV or impaired immunity from therapies like chemotherapy or anti-inflammatory.

But previous research from Norris, postdoctoral fellow Emily Rayens and the College of Public Health's José Cordero in 2022 showed that at-risk population has expanded

in recent years.

That study showed people with diabetes; chronic obstructive pulmonary disease (or COPD); or co-infections such as COVID-19, tuberculosis or flu are likewise at higher risk of developing fungal infections.

The first line of defense is typically treatment with azoles, which are broad-spectrum anti-fungal medications. But antifungal resistance is growing. As a result, fungal infections are becoming more difficult to treat, making prevention even more critical, Norris said.

The new vaccine targets the three most common causes of fungal infections: Aspergillus, Candida and Pneumocystis. Candida, in particular, is a growing concern in health care circles as different strains of the fungus become multidrug resistant.

Tool to decipher bacterial infections in real time

A research team led by Professor Xiang David Li from the Department of Chemistry at The University of Hong Kong (HKU) has developed a novel chemical tool to reveal how bacteria adapt to the host environment and control host cells. This tool can be used to investigate bacterial interactions with the host in real-time during an infection, which cannot be easily achieved by other methods.

Pathogenic bacteria, while only numbering fewer than a hundred, heavily threaten human health all over the world. For example, Mycobacterium tuberculosis infection causes tuberculosis, which leads to more than one million deaths each year. It was the world's deadliest infectious disease until it was overtaken by COVID-19. Despite effective antibiotic treatments, multiple drug-resistant tuberculosis has become a growing problem worldwide. Therefore, a more comprehensive understanding of how bacteria infect their human host is key to developing new drugs and therapies.

When bacteria meet their host (e.g., human cells), they send out 'assassins' (virulence factor proteins) that 'hijack' important protein players of the host to sow chaos during an invasion. Therefore, investigating which virulence factors bacteria secrete and which host proteins are targeted is crucial for the understanding of bacterial infections. However, it can be extremely challenging to identify these key players among the 'crowded streets' (excessive host cellular matrix).

To tackle this challenge, Professor Li's group designed a multifunctional unnatural amino acid called photo-ANA that only labels proteins of the engineered bacteria but not the host during infection. With the help of its alkyne handle,

photo-ANA can conjugate with fluorescence or biotin via a Nobel prize-winning chemical reaction ('click' chemistry), which enables the visualisation and enrichment of the labelled bacterial proteins from the complex host environment. Thus, Photo-ANA serves as an 'undercover agent' to gather intelligence and tag all the 'assassins' sent by the bacteria. More importantly, photo-ANA also carries a diazirine group that can 'handcuff' the bacterial virulence proteins to their host target proteins upon exposure to ultraviolet (UV) light -- catching them in the act.

Using photo-ANA,

Professor Li's group comprehensively profiled the adaptation of Salmonella, bacteria that can cause severe diarrhea, to the host environment and revealed the extensive interplay between Salmonella and the host during different infection

stages, which identified known interactions and some newly discovered interactions. Moreover, the photo-ANA-based approach can be easily applied to other pathogenic bacteria and even other pathogens such as fungi.

With this new chemical tool, scientists can now investigate the activity of bacteria inside the host in real-time. In the future, this tool may help us decipher the hidden interactions of deadly bacteria with the host and the mechanisms of multidrug-resistant superbugs, which will further our understanding of infectious diseases and inspire new treatments.

DOCUMENT LOST

This is to inform that my client, Mr. S. Sampath had misplaced the original document of title deed dated 06.09.1984 bearing doc.no.1221/1984, on file of SRO Myslapore, bearing flat no.15, 1/4 th UDS out of 582 sq.ft., comprised in survey no.3066/1, Mosque Street at Myslapore in favour of him. My client brought the original deeds to take Xerox outside the bank near Jayanthi bus stop, Thiruvanniyur, it had been lost on 30.03.2021 the way and in spite of inquiry at nearby and his best effort to trace out the same, he could not find the said original document. Hence it is informed to the General public that if any one who is/are finds the above mentioned document hereby called upon to handover the above mentioned documents to us within fifteen days from the date of publication of the notice at the address below mentioned. It is further informed that no person shall deal with the above mentioned original document in any manner, encumbering the property by misusing the misplaced documents the same will not have any legal sanctity and are punished under law.
