For Royal Sense Limited

Rishabh Arora
Managing Director
DIN: 09745543

Royal Sense Limited is excited to announce the official launch of our latest Medical Device, the Stergic Iris Arm Sling is an arm sling supports and immobilizes the arm and shoulder after injury or surgery, aiding in recovery and comfort.

Here are some details you might find in a Stergic Iris Arm Sling

An arm sling is a medical device used to support and immobilize the arm and shoulder following injury, surgery, or other conditions affecting the upper limb. It typically consists of a piece of cloth or fabric that wraps around the neck and supports the injured arm in a raised and comfortable position against the body. Arm slings are crucial for reducing movement in the injured area, which promotes healing by preventing further damage and allowing tissues to repair.

The primary purpose of an arm sling is to provide support and stability, reducing pain and discomfort associated with arm injuries such as fractures, sprains, dislocations, or post-operative recovery. By limiting movement, slings help to protect injured tissues, joints, and bones from additional strain or injury.

Arm slings come in various types and designs, including simple triangular slings, shoulder immobilizers that provide additional support to the shoulder joint, and adjustable slings that allow for customization of fit and comfort. Proper fitting of the sling is essential to ensure effective immobilization without causing undue pressure or discomfort.

In addition to immobilization, arm slings contribute to patient comfort by relieving strain on the injured arm and promoting a more natural resting position during recovery. They also serve a psychological role by signaling to others the presence of an injury and encouraging appropriate care and consideration.
