9. Briefly describe the waste management practices adopted in your establishments. Describe the strategy adopted by your company to reduce usage of hazardous and toxic chemicals in your products and processes and the practices adopted to manage such wastes.

In the process of sponge iron production, coal is used for generating heat and chemical reaction for reducing the oxygen from iron ore, During this metallurgical process reaction, along with sponge iron, coal char and flue gas is generated as by product of DRI Process. In order to utilise Waste, this coal char is being used as a fuel for the generation of power in captive power plant. By utilizing the char in power Generation Company is saving proportionate quantity of coal and contributing for conservation of natural resources and keeping the nature and atmosphere clean. To utilize the flue gas of the DRI Process the company has installed the Waste Heat Recovery System for Generation of Power by utilizing the Flue gas.

The Waste generation of Power Plant is Fly ash is being used in brick /block making, road making, and various concrete applications and is disposed off in abandoned mines. We are having fly ash brick manufacturing plant inside our premises. Fly ash bricks are used in all type of construction carried out in the plant. Apart from this we are also disposing off fly ash in mines and low lying areas. All safe and scientific methods are being adopted during handling, transportation and dumping of fly ash.

The Slag generated during the process of steel making in Induction Furnace contains Iron particles mixed with slag. To recover the iron particles, magnetic slag crusher has been established. The recovery of Iron particles is approximately 10% which is reused in the process of induction furnace for steel making. By this, proportionate amount of raw material i.e., mineral is saved. By doing such practices, we are using a waste as a source of energy & controlling environmental pollution and conserving the natural resources. As far as remaining part of slag is concerned, we are using it for levelling work and road making etc.

We have provided Bag filter system for control of source emission and Fogging system for fugitive emission which are working more efficiently. We have deployed a road cleaning machine for better house keeping of the plant. We have CC roads in the plant to minimize dust emission during vehicular movements. Time to time, we have made retrofitting work of ESPs, Bag filters, Venture scrubber systems & Fume scrubber systems to improve efficiency of air pollution control devices and to minimize the pollution load in the environment. We have regular programmes for plantation and this year we have planned to plant 10000 saplings in the plant premises. We are implementing effluent treatment plant and reuse of treated wastewater for cooling tower make up water, dust separation systems, pug mills area, ash handling systems, water spraying in raw material storage yard & finished product area, cleaning of road area, horticulture & plantation purpose. This has been saving the consumption of fresh water. We have installed sewage treatment plant for treatment of domestic water and are using treated water for plantation purpose.

The Company is installed the following systems for utilization of waste and reducing the adverse impact on the environment.

- (i) WASTE HEAT RECOVERY BOILER (WHRB):

WHRB is a well known technology for the generation of power from the waste heat, generated from source. Here, we use waste heat from rotary kiln where coal is used for the generation of heat for the purpose of melting of raw materials used for sponge production. Instead of leaving the huge quantity of heat in atmosphere which could unbalance its stability; we use it for 75 MW power generation. The generated power from the process is used for Industrial use. By this process, we are preventing to release the hot gases in atmosphere and on the other hand we are re-cycling & re-using our waste resources.

- (ii) UTILIZATION OF COAL CHAR:

In the process of sponge iron production, coal is used as a raw material for generating heat. At the end of the process, coal char is also generated. This coal char is solid waste after the process which we are using as fuel for the generation of power in captive power plant.

Utilizing the char in power generation, we are saving our surroundings with clean nature & atmosphere.

PRAKASH INDUSTRIES LIMITED

(iii) SLAG CRUSHER:

Slag is generated during the process of steel making in Induction Furnace which contain Iron particles mixed with slag. To recover the iron particles, magnetic slag crusher has been established. The recovery of Iron particles is approximately 10% which is reused in the process of Induction furnace for steel making. By this, substantial amount of raw material (i.e., mineral) is saved. By doing this, we are using waste as a source of mineral & controlling environmental pollution.
