Date: 31<sup>st</sup> May, 2024

To,  
**Department of Corporate Services  
BSE Limited**  
Ground Floor, P. J. Tower,  
Dalal Street, Fort,  
Mumbai- 400 001

Dear Sir/Madam,

**Security ID: GNRL**

**Security Code: 513536**

**Sub: Copy of Advertisement of Audited Financial Results for the quarter and year ended on  
31/03/2024**

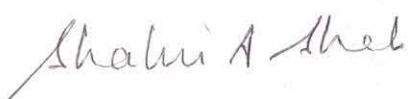

Please find enclosed herewith copy of Advertisement of Audited Financial Results (Standalone & Consolidated) for the Quarter and year ended on 31<sup>st</sup> March, 2024 as per the Regulation 47(1)(b) and 47(3) of the SEBI (Listing Obligations and Disclosure Requirements) Regulations, 2015 published in one English daily newspaper and one daily newspaper in the language of the region, where the registered office of the company is situated.

Please take the same on your record.

Thanking You.

Yours faithfully,

**For Gujarat Natural Resources Limited**

  
**Shalin A. Shah**  
Managing Director  
DIN: 00297447

**New Drinkable Foam Boosts Effectiveness of Experimental Cancer Therapy**

Did smokers do better than non-smokers in a clinical trial for an experimental cancer treatment? That was the intriguing question that led University of Iowa researchers and their colleagues to develop a drinkable, carbon monoxide-infused foam that boosted the effectiveness of the therapy, known as autophagy inhibition, in mice and human cells. The findings were recently published in the journal Advanced Science. Looking for ways to exploit biological differences between cancer cells and healthy cells is a standard approach for devising new cancer treatments. But it is a painstaking process that requires a deep understanding of complex cancer biology and often a dose of unexpected insight. Researchers have known for several decades that autophagy, which is the cell's natural recycling system, is increased in cancer cells relative to healthy cells, suggesting that inhibiting autophagy might be a way to target cancer cells. However, results from almost 20 clinical trials testing autophagy inhibitors have been inconclusive. "Within those clinical trials they found mixed results; there was some benefit, but for many patients, there was no benefit, which really pushed researchers back to the drawing board," says James Byrne, MD, PhD, UI assistant professor of radiation oncology and biomedical engineering and senior author on the new study. Searching for insight into why autophagy inhibition only seems to work some of the time, the researchers made the surprising discovery that smokers in two of the previous trials of autophagy inhibitors seemed to do better than non-smokers.

"When we looked at how the smokers did in those trials, we saw an increase in overall response in smokers that received the autophagy inhibitors, compared to (non-smoker) patients, and we also saw a pretty robust decrease in the target lesion size," Byrne says.

This was an exciting finding for Byrne and his team because smoking is also associated with increased levels of carbon monoxide, a gas molecule that can increase autophagy in cells in a way that researchers think might enhance the anti-cancer effect of autophagy inhibitors.

"We know also that smokers have higher carbon monoxide levels and while we definitely don't recommend smoking, this suggested that elevated carbon monoxide might improve the effectiveness of autophagy inhibitors. We want to be able to harness that benefit and take it into a therapeutic platform," says Byrne, who also is a member of University of Iowa Holden Comprehensive Cancer Center. The team already had just such a "platform" to test their ideas. Byrne specializes in crafting gas-trapping materials (GEMs)—foams, gels, and solids made from safe, edible substances that can be infused with different gas molecules. For this study, the researchers created a drinkable foam infused with carbon monoxide.

When mice with pancreatic and prostate cancers were fed the carbon monoxide foam and simultaneously treated with an autophagy inhibitor, tumor growth and progression were significantly reduced in the animals.

# Apple: Vision Pro Headset Enables 'Spatial Computing'

Technology company Apple's new computing device, the Vision Pro headset, became available in stores last week.

The device uses augmented reality technology which has been available for years. But Apple calls the technology "spatial computing." The device is

worn on the head over the eyes. Apple hopes the Vision Pro will be as popular as the iPhone, Apple's cellphone that came out in 2007.

"We can't wait for people to experience the magic," Apple chief Tim Cook said while discussing the Vision Pro. The Vision Pro will also be among Apple's most costly products at \$3,500. Many

researchers say the high cost means the company might sell 1 million or fewer of the devices during its first year.

But even the iPhone was not extremely successful in its first year on the market. Apple only sold about 4 million iPhones back then. Now, the company sells more than 200

million of them each year. If the Vision Pro succeeds, the term "spatial computing" might become popular.

"Spatial computing" describes how the physical world and the virtual world of computers can work together.

Augmented reality (AR) and artificial intelligence (AI) are two areas of computing that help make spatial computing happen, said Cathy Hackl. She runs a new company that makes programs for the Vision Pro.

Hackl said, "Spatial computing will enable devices to understand the world in ways they never have been able to do before." She added that it is going to change the way humans and computers work together. Apple says

more than 600 newly designed programs, or apps, will be available to use on the headset right away. Apps will include television networks and video services although Netflix and Google's YouTube will not be available.
