Sanofi, IDF and PHFI partner to fight diabetes among children in India

- KIDS (Kids and Diabetes in Schools) project aims to foster a school environment that creates a better understand of diabetes and support children with this condition –

Mumbai, India – September 30, 2013 – Sanofi (EURONEXT: SAN and NYSE: SNY), the International Diabetes Federation (IDF) and Public Health Foundation of India (PHFI) announced today *their first joint public health initiative in India*, KIDS (Kids and Diabetes in Schools). For children with Type 1 diabetes, the project aims to encourage a safe and supportive school environment to manage their diabetes and avoid discrimination. In addition, the program will raise awareness on diabetes (Type 1 and Type 2) and benefits of healthy nutrition and exercise habits among school children.

In India, diabetes is a major public health challenge and the country is today ranked at no. 2 globally. While Type 2 diabetes has received considerable attention in interventions, it has not been so for Juvenile or Type 1 diabetes, even though **1 out of 5 children with Type 1 diabetes in the world would be an Indian**. (ref.: International Diabetes Federation Diabetes Atlas. 5th ed. Brussels: IDF; 2011)

If Type 1 diabetes is not detected and diagnosed, it could pose a grave challenge for children and families, who need adequate knowledge and resources for effective management of the condition.

Schools are ideal to raise awareness and train students, teachers and parents about Type 1 diabetes. These days, universal primary education with 'Education for All' as the central theme, is at the forefront of governmental policy. The proposed school based intervention will not just focus on Type 1, but also Type 2 diabetes since the prevalence of obesity is increasing and people are developing Type 2 diabetes at a younger age. This will ensure overall benefit to school children of all age groups and their families.

Launching the KIDS project at a media conference in Mumbai, Chris Viehbacher, Chief Executive Officer, Sanofi stated *"As a global leader in diabetes care, we focus on bringing real benefits to people with diabetes, not just providing a comprehensive portfolio of treatments and innovative patient-friendly devices, but also accompanying them in their daily life. With close support, we can really make a difference in patient outcomes so we are very committed to partnering with key stakeholders to create the best patient support programs possible. In India, through our alliance with IDF and PHFI, the KIDS project will help children with Type 1 diabetes fight discrimination and manage their disease better. The project will also include health education for the school children to curb the increasing burden of Type 2 diabetes."*

"In a developing country like India, barriers to diabetes self-management at school are significant." said **Sir Michael Hirst, President of IDF**. *"By engaging with policy makers and education authorities, organizing meetings in local communities and providing educational resources to schools, KIDS will raise awareness of diabetes, and the benefits of healthy nutrition and exercise habits among school-age children. IDF is delighted that, in partnership with Sanofi and PHFI, KIDS will bring about a systemic change for children with diabetes in schools."*

Dr. K Srinath Reddy, President - PHFI shared that "The program's first step was a feasibility study to understand the status of diabetes management by reviewing current policies on diabetes in schools, existing school guidelines and initiatives, any best practices -- and identify gaps in the knowledge so that appropriate

resources and dissemination routes can be developed. We found that there are no structured training programs, plan or activity, implemented in the school settings that focus on diabetes management. Almost all the respondents emphasized the need for a comprehensive awareness/educational programme in schools to sensitize students, teachers and parents on management of Type 1 diabetes, and control of risk factors for Type 2 diabetes."

Type 1 diabetes is a challenge especially for school-going children who have to cope with the disease and also face stigma associated with it. They are required to follow a structured self-management plan including lifelong insulin use and blood glucose monitoring, physical activity, and a healthy diet. Therefore, the results and learnings from the KiDS project will not only help support children with Type 1 diabetes but also foster a school environment that creates a better understanding of the condition.

About KiDS project:

The KiDS project milestones include:

- **Phase 1 in 2014** -Awareness meetings and activities in schools, with key stakeholders from regional authorities, nurses, teachers, parents and children
- Development and distribution of a school diabetes information pack to help teachers educate children about diabetes
- A Global 'Diabetes in Schools' Toolkit for IDF Member Associations to roll out the project, across India and in other parts of the world

Phase 2 -

- Will seek to continue to work with a multi-stakeholder approach to support the children with diabetes in school and to fight discrimination.

About Diabetes

Diabetes is a chronic disease that occurs as type 1 diabetes, which is an autoimmune disease characterized by the lack of insulin (the hormone that regulates blood glucose concentrations) production by the pancreas, and Type 2, a metabolic disorder in which there are two main biological defects: a deficient production of insulin and reduced ability of the body to respond to the insulin being produced.

Type 1 and Type 2 diabetes are characterized by an increase in blood glucose concentrations (hyperglycemia). Over time, uncontrolled hyperglycemia leads to the macrovascular and microvascular complications of diabetes. Macrovascular complications, which affect the large blood vessels, include heart attack, stroke and peripheral vascular disease. Microvascular complications affect the small blood vessels of the eyes (retinopathy), kidney (nephropathy) and nerves (neuropathy). The global incidence of diabetes is growing at an alarming rate, with more than 371 million people worldwide living with the condition today.

The International Diabetes Federation has reported that the 63 million diabetic patients in India in 2012 would rise to 101.2 million by 2030¹. In India, the Type1 burden is estimated at 97,700 children¹¹.

Challenges of Type 1 diabetes in children

In addition to the rigors of treatment, many children and adolescents find it difficult to cope emotionally with their condition. Diabetes can result in discrimination and may limit social relationships. It may also have an impact on how well a child does in school. The costs of treatment and monitoring equipment combined with the daily needs of a child with diabetes may place a serious financial and emotional burden on the whole family. In many countries, access to self-care tools including self-management education and also to insulin is limited, and this may lead to severe handicap and early death in children with diabetes.
